

Is the Lithium Ion battery safe?

As with any battery, there are some safety considerations. Excessive heat is not good for the battery. When the temperature where the bicycle is stored exceeds 80-85 degrees, it's wise to bring the battery into a cooler space. As a safety feature, most manufacturers provide a charger that will automatically shut off when the charge is completed.

How long does it take to fully charge the battery?

The length of time needed for a full charge varies from manufacturer to manufacturer. The amount of time depends largely on the size of the charger and the capacity of the battery. Depending on how low the battery is, charging will typically take 3-6 hours. Please note, it is not advisable not to allow the battery to sit when it is below 20% charged.

How long will my battery last?

Many factors influence the life of a battery. Manufacturers typically give an indication of how long you can expect the battery they provide to last.

What about when I need to replace my battery?

Batteries are available from the manufacturer of your bike as well through third-party sellers. Prices vary widely.
